Dinamica Generale: Discover the Difference of Precision Feeding

With over 30 years of experience in precision agriculture, Dinamica Generale is a trusted name in the dairy industry, providing advanced solutions to help farmers streamline operations and boost productivity. Our Daily TMR Manager (DTM) software is designed to make feed management more efficient, reducing feed waste and improving herd health.

At Dinamica Generale, our commitment to innovation ensures our tools remain affordable, scalable and easy to use, serving dairy farms of all sizes. From small operations with 100 cows to large-scale farms with thousands, DTM can be tailored to meet each farm's unique needs.

But what exactly is DTM and what does it do?

In this guide, we'll explore how DTM can help you streamline feed management processes, cut costs and enhance milk production. We'll also walk you through the software's key features, its financial benefits and how you can get started.

What Is Feed Management Software?

The DTM precision feeding system is designed for farmers to control all stages of the animal nutrition process from recipe preparation, to data transmission, to the distribution of feed rations.

DTM manages all data collected daily within the feed process and turns them into useful information to increase efficiency and farm performance.

The platform consists of DTM — Daily TMR Manager (the comprehensive feed management software in the Cloud, designed to optimize daily feed process); a programmable weight indicator; a 4G modem for data exchange; and the DTM app to monitor the key performance of your farm.

Feed Mixer Weighing Technology

DTM WEB APP

DTM MOBILE APP

Whether you manage a family-run operation or a large commercial dairy, DTM simplifies feed management for every sized farm. This cloud-based tool integrates seamlessly with existing farm equipment, such as feed mixers scale, to ensure that each cow receives the precise amount of feed required.

Why Pen and Paper Just Won't Cut It

While some farmers might be fine using spreadsheets or pen and paper, relying on these methods to track feeding is not only time-consuming but also prone to errors. This can quickly lead to costly overfeeding or underfeeding.

DTM replaces these outdated methods with a real-time, automated solution that improves accuracy and efficiency. The software integrates with your farm's feed mixer scale and allows you to monitor feeding performance through live data.

This means you can make adjustments on the go, ensuring that every cow gets exactly what it needs, no more and no less.

The ability to track feed consumption and manage inventory also helps you avoid shortages and overstocking.

With DTM, you gain the power to adjust rations automatically, for example when there are changes in components dry matter or in pen or herd sizes, improving feed efficiency and reducing manual labor for you and your team.

What Sets DTM Apart?

- ✓ **Manage your feed operations remotely**
- ✓ **Track feed inventory and efficiency**
- ✓ **Adjust rations in real-time to prevent overfeeding**
- ✓ **Monitor key metrics like dry matter intake**
- ✓ **Reduce waste and save on feed costs**

DTM's cloud-based control is a standout feature, giving you the ability to manage feeding operations remotely. Whether you're on the farm or on vacation, you can access real-time data, make adjustments and monitor feeding schedules from any device.

The software also features an intuitive interface, providing clear, easy-to-read reports and charts that help you track feeding performance and feed costs. With its integration into existing herd management systems, DTM simplifies feed ration adjustments, automatically updating based on changing herd sizes, without requiring manual calculations.

Meanwhile, the DTM dashboard provides live farm data through a detailed dashboard, allowing you to see feeding patterns and inventory levels at a glance. Automated updates ensure that your farm is always running efficiently and that feeding data is accurate.

The Financials of Precision Feed Management

Feed is one of the largest expenses for dairy farms, accounting for up to 70% of operational costs.¹ By using DTM's precision feed management, you can optimize feed usage and significantly reduce waste, leading to immediate cost savings.

DTM allows you to track feeding costs in real-time, offering insight into your Income Over Feed Costs (IOFC) — a key performance metric in dairy farming. By ensuring that feed rations are accurate and consistent, you'll not only save money but also increase milk production, improving overall profitability.

The ability to automate ration adjustments based on herd size changes further enhances cost efficiency, ensuring that you're never overfeeding or underfeeding your cows.

70% Feed is one of the largest expenses for dairy farms, accounting for up to 70% of operational costs.¹

Getting Started With DTM From Dinamica Generale

Setting up DTM is simple. The system easily integrates with your existing feed mixer — all you need is a Dinamica Generale indicator, and installation takes less than 10 minutes.

After setting up the 4G modem for remote access, you're ready to go.

Once installed, DTM automatically syncs with your mixer, providing real-time data and allowing you to manage feed operations from anywhere.

To ensure a smooth transition, Dinamica Generale offers a variety of training resources, including video tutorials available in multiple languages, and ongoing support through a dedicated ticketing system.

**Ready to take control of your
farm's feed management?**
